Management of Space Optimization Approaches

Suggestions:

Split the parking into categories

イロト イヨト イヨト イヨト

Management of Space Optimization Approaches

Suggestions:

- Split the parking into categories
- Assign a cost to each category

イロト イポト イヨト イヨト

Management of Space Optimization Approaches

Suggestions:

- Split the parking into categories
- Assign a cost to each category
- Assign proportion of population for each type of parking

イロト イポト イヨト イヨト

Management of Space Optimization Approaches

Suggestions:

- Split the parking into categories
- Assign a cost to each category
- Assign proportion of population for each type of parking
- Assign priorities to population

イロト イポト イヨト イヨト

Management of Space Optimization Approaches

Suggestions:

- Split the parking into categories
- Assign a cost to each category
- Assign proportion of population for each type of parking
- Assign priorities to population
- Define parking policies

イロト イポト イヨト イヨト

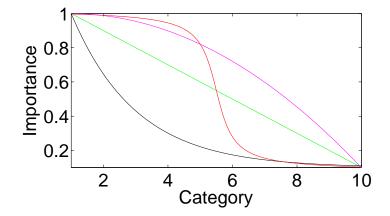

Management of Space Optimization Approaches

Suggestions:

- Reserved (x_1 spaces for $N_1 = x_1$ VIPs)
- Open for Staff (x₂ spaces for N₂ Staff members)
 - If $\alpha_2 = \frac{x_2}{N_2}$, what is the *best* value to choose for α_2 ?
- Open to All (x_3 spaces for the N_3 remaining to fight for)
 - First Come First Served
 - Staff without parking can come here

- Minimize Unhappiness (Users)

イロト イポト イヨト イヨト

Management of Space Optimization Approaches

Suggestions:

- Maximize Income (University)
- Maximize Parking Use (University and Users)
- Minimize Unhappiness (Users)
- Possible combination of the above

イロト イポト イヨト イヨト

Problem formulation Method Algorithm Alternate solution Example

Minimizing Unhappiness

Unhappiness is not easy to define Suggestion:

▶ Individual: $u_i = w_i X_i$ where w_i is the weight

$$X_i = \begin{cases} 0 \\ \alpha \quad (0 < \alpha < 1) \\ 1 \end{cases}$$

if satisfied

if parking found but far if no parking found

イロン イヨン イヨン イヨン

• General:
$$G = \sum_{i} u_i$$

Problem formulation Method Algorithm Alternate solution Example

Minimizing Unhappiness

Input

- Divide the N people into categories
- Assign ranking r_i to people according to their category
- Consider the time t_i each applicant spent in the system
- Consider the office building b_j
- Consider the parking P_k with m_k bays $(\sum_k m_k = M)$
- Consider the distance d_{jk} from b_j to P_k

イロト イポト イヨト イヨト

Problem formulation Method Algorithm Alternate solution Example

Minimizing Unhappiness

Procedure:

Assign a weight w_i to each applicant

$$w_i = r_i \times t_i \tag{1}$$

- Each applicant is coded as a vector $[w_i, b_j]$
- Choose the *M* applicants with the highest weight
- Choose the closest available parking according to the weight
- The remaining are distributed in the open space
- Anyone out of the system brings the first on the waiting list in the system

イロト イポト イヨト イヨト

Problem formulation Method Algorithm Alternate solution Example

Minimizing Unhappiness

For category *i*, choose the number of allocated parking bays proportional to the ranking

$$x_i = \frac{M \times r_i \times N_i}{\sum\limits_i r_i \times N_i}$$

ヘロン 人間 とくほど くほとう

Problem formulation Method Algorithm Alternate solution Example

Minimizing Unhappiness

We have 10 applicants divided into 3 categories working in two buildings with two available parkings (3 bays per parking).

イロト イヨト イヨト イヨト

What was done

- Define different policies
- Translate them in mathematical terms
- Define possible goals
 - Maximize profit
 - Maximize space usage
 - Minimize unhapppiness
- Arbitrary choices
- Solution highly dependent on objectives

- Data analysis
- Case study
- Generalize the presented solutions
 - Study more complex cases
 - Problem not specific to universities
